Pompe's disease (GSD II) test

Name	Breed	Result
Thistleghen Chiquitita	Finnish Lapphund	Normal
Reg. No AL00331903		

Test results are reported as follows:

Glycogen storage disease type II is also known as acid maltase deficiency or generalized glycogenosis type II. Glycogen storage disease type II is a disorder of glycogen metabolism that affects Finnish Lapphund, Swedish Lapphund and Lapponian herder. The disease can manifest as vomiting, muscle weakness with exercise intolerance, and poor growth.

- Normal:** The dog carries two normal copies of the gene and has no or reduced likelihood of developing the disease during its life.
- Carrier:** The dog carries the mutation in one of its chromosomes and transfers it to approximately 50% of its offspring. If a carrier must be mated, it should only be with a genetically tested healthy non-carrier.
- Affected:** The dog carries two copies of the mutation and is at high risk of developing GSD II during its life. An affected animal, even if not yet showing symptoms, will pass on the mutation to all its offspring, and its use in breeding is not recommended.
